Theme Song: https://youtu.be/Pt28Ex-ta0E

- **[Problem]**
  - How prevention methods (social distancing, wearing mask, washing hands) affect the infection curve in a community
- **[Intervention]**
  - Social distancing, wearing mask, washing hands and the ones without any prevention methods
- **[Goal(s)]**
  - Analyze and visualize how the disease propagates amongst groups with different behaviors in a population

Our code

- We added variables to manage the groups in our population based on a counter. Plus we changed the risk of infection of each individual in the population based on the usage of prevention methods and how much they decreased the risk of infection.
- Group Github Repo Link https://github.com/revv-tech/Hackaton_TheBigLab.git

Our code

- ★ The main function of our code was one called set_data_lists(), and its purpose was to divide in groups our total population based on the person's state. We called this function for each day.
- ★ We manipulated the data using pandas dataframe and stored them using csv files.
- ★ We developed the plots using matplotlib and pandas.
